## National University of Computer and Emerging Sciences, Lahore Campus

Course Name: **Computer Organization and** 

**Assembly Language** 

**BS(Computer Science)** Program:

180 Minutes **Duration:** 

Paper Date: 31st December, 2018

Section: ALL Exam Type: **FINAL**  Course Code: **EE213** Semester: Fall 2018 **Total Marks:** 100

Weight 45% Page(s): 10

Student: Name:		Roll No	Section:
Instruction/Notes:	1	Evam is Onen hook Onen notes	

- 2. Properly comment your code.
- 3. Syntax error will result in **negative** marking.
- 4. Write your answer in the space provided. You can take extra sheets BUT they WONT BE ATTACHED WITH THE QUESTION PAPER OR MARKED.

Question1. Answer the following multiple choice questions. NO cutting or Over Writing. [2x10 Marks] For this question, please put your answers in the following table. No answer will be marked other than this table.

S.No	Answer	S.No	Answer
i.		vi.	
ii.		vii.	
iii.		viii.	
iv.		ix.	
v.		х.	

Assume the initial values for registers/flags are: DF=0, SI=0x100, DI=0x200. And the following are the initial i. memory values at given memory address:

Memory Address	0	1	2	
0x0100	0x10	0x15	0x22	
0x0200	0x20	0x25	0x21	

After executing the movsb instruction, the updated values of registers and relevant memory address will be:

- a. 0x100 contains 0x20, 0x200 contains 0x20, DI=0x201, and SI=0x101
- b. 0x100 contains 0x20, 0x200 contains 0x20, DI=0x202, and SI=0x102
- c. 0x100 contains 0x10, 0x200 contains 0x10, DI=0x201, and SI=0x101
- d. 0x100 contains 0x10, 0x200 contains 0x10, DI=0x1FF, and SI=0x1FF

- ii. The operation of "push ax" is equivalent to:
  a. SP ← SP -2
   [SP] ← AX
  b. SP ← SP -2
   SP ← AX
  c. [SP] ← AX
  sP ← SP -2
- **iii.** The video display memory is divided into 25 rows and 80 columns. Assuming that the rows are numbered from 0 to 24 and columns are numbered from 0 to 79 and es has 0xb800, the instruction "mov word [es:1700], 0x0735" puts the number 5 at which of the following location:
- a. Row=10, Column=50
- b. Row=9, Column=50

d.  $SP \leftarrow SP + 2$  $[SP] \leftarrow AX$ 

- c. Row=10, Column=49
- d. Row=9, Column=49
- **iv.** Imagine a sub-routine being called from the main program. The main program passes one argument (parameter) to the sub-routine. How exactly will the subroutine access this parameter?
- a. [bp-2]
- b. [bp]
- c. [bp+2]
- d. [bp+4]
- **v.** The instruction that is used as prefix to a string instruction to execute it repeatedly until the CX register becomes zero is:
- a. SCAS
- b. CMPS
- c. REP
- d. REPN
- vi. Suppose AL=11001011, CL=2 and CF=1. Give the new contents of AL after executing "sar al, cl".
- a. AL=11100101, CF=1
- b. AL=10010010, CF=1
- c. AL=11110010, CF=1
- d. AL=00110010, CF=1
- vii. Suppose AL=11001011, CL=3 and CF=1. Give the new contents of AL after executing "rcl al, cl".
- a. AL=10010111, CF=1
- b. AL=00101111, CF=1
- c. AL=01011111, CF=0
- d. AL=01011111, CF=1
- viii. Imagine a sub-routine being called from the main program. The sub-routine declares a local variable to store and process some data. How exactly will the subroutine access this local variable?
  - a. [bp-2]
  - b. [bp]
  - c. [bp+2]
  - d. [bp+4]

- ix. Suppose SP=0x0200, and top of stack = 0x012A. What are the contents of IP and SP after "ret 4" where ret appears in a near procedure.
- a. IP = 0x012A, SP=0x206
- b. IP = 0x012A, SP=0x1FA
- c. IP = 0x0200, SP=0x204
- d. IP = 0x012A, SP=0x202
- **x.** Imagine that the DL register contains a number between 0 and 9. The instruction "OR DL,0x30" results in DL to contain:
- a. The original number
- b. The original number with sign bit reversed
- c. Corresponding character between '0' and '9'
- d. The original number multiplied with 3

Question2. Write the output of the following short programs. [4x7 Marks]

For this question, please put your answers in the following table. No answer will be marked other than this table.

S.No	Answer
	Updated Array values after code execution:
i.	
ii.	
	Value of [num1]:
iii.	
	Final Value of DX:
iv.	
IV.	Updated Value of Str2:
v.	AX=BX=
	CX= DX=
vi.	Updated value of DL Register:
vii.	Value of Seconds:
	Reason:

i. Write the updated contents of 'array' (in decimal only) after execution of the following code.

```
[org 0x0100]
    push ds
    pop es
    std
    mov si, array+8
    mov di, array+10
    mov cx, 3
    rep movsw
    mov word [di], 30
    mov ax, 0x4c00
    int 0x21
array:    dw 10, 20, 40, 50, 60, 0
```

ii. What's the final value of the num1 memory location? Answer in hex or decimal.

```
[org 0x0100]
       mov dx, 0x0730
       mov cx, 10
       xor bx, bx
loop1: dec cx
       mov ax, cx
       add dx, ax
       and dl, 0x0F
       add bl, dl
       mov dx, 0x0730
       or cx, cx
       jnz loop1
       mov word [num1], bx
       mov ax, 0x4c00
       int 0x21
num1: dw 0
```

iii. What is the final value of DX register (in hex) after executing the following code?

```
[org 0x0100]
       mov si, str1
       mov di, str2
       push ds
       pop es
       cld
       mov
               cx, [len]
       xor dx, dx
again: jcxz done
       repne cmpsb
       jne
               done
       inc
               dx
       jmp again
done: mov ax, 0x4c00
       int 0x21
len:
       dw8
       db 'Ukraine.'
str1:
       db 'Romania.'
str2:
```

iv. Write the contents of "str2" after executing the following program.

```
[org 0x0100]
        mov si, str1
        mov di, str2
        mov cx, [len]
        add di, cx
        dec di
        push ds
        pop es
        cld
next:
       movsb
        sub di, 2
        loop next
        mov ax, 0x4c00
        int 0x21
len:
        dw 17
        db 'Never odd or even'
str1:
       db 'Final Examination'
str2:
```

**v.** Suppose that AX = 0x1234, BX = 0x5678, and CX = 0x9ABC, and SP=0x0100. Give the contents of AX, BX, CX, and SP after executing the following instructions:

```
push ax
push bx
xchg ax, cx
pop cx
push ax
pop bx
```

vi. How does the following code snippet update the value of DL register? Assume that the initial value of DL register is 11011100.

```
mov cx, 8
tag1: shl dl,1
rcr bl,1
loop tag1
mov dl,bl
```

vii. Given the following piece of code, what will be the value of 'seconds' if we keep space bar pressed for 7 seconds? Assume that keyboard and timer ISR are correctly hooked in the 'main'. Give reason for your answer in maximum two lines.

in al, 0x60 ; read char from keyboard port cmp al, 0x4B ; assume that 0x5B is scancode of 'space bar' jne nextcmp cmp word[cs:timerflag], 1 je exit mov word[cs:timerflag], 1 jmp exit  nextcmp: cmp al, 0xBB jne nomatch mov word[cs:timerflag], 0 exit: mov al, 0x20 out 0x20, al pop ax iret  ; timer ISR timer: push ax cmp word[cs:timerflag], 1 jne skipall inc word[cs:seconds] push word[cs:seconds] call printnum ; print tick count	kbisr:	push ax	
jne nextcmp cmp word[cs:timerflag], 1 je exit mov word[cs:timerflag], 1 jmp exit  nextcmp:  cmp al, 0xBB jne nomatch mov word[cs:timerflag], 0 exit: mov al, 0x20 out 0x20, al pop ax iret  ; timer ISR timer:  push ax cmp word[cs:timerflag], 1 jne skipall inc word[cs:seconds] push word[cs:seconds] call printnum ; print tick count		in al, 0x60	; read char from keyboard port
cmp word[cs:timerflag], 1		cmp al, 0x4B	; assume that 0x5B is scancode of 'space bar'
je exit mov word[cs:timerflag], 1 jmp exit  nextcmp: cmp al, 0xBB jne nomatch mov word[cs:timerflag],0  exit: mov al, 0x20 out 0x20, al pop ax iret  ; timer ISR  timer: push ax cmp word[cs:timerflag], 1 jne skipall inc word[cs:seconds] push word[cs:seconds] call printnum ; print tick count  skipall:		jne nextcmp	
mov word[cs:timerflag], 1 jmp exit  nextcmp: cmp al, 0xBB jne nomatch mov word[cs:timerflag],0  exit: mov al, 0x20 out 0x20, al pop ax iret  ; timer ISR  timer: push ax cmp word[cs:timerflag], 1 jne skipall inc word[cs:seconds] push word[cs:seconds] call printnum ; print tick count  skipall:		cmp word[cs:timerflag]	, 1
jmp exit  nextcmp: cmp al, 0xBB  jne nomatch  mov word[cs:timerflag],0  exit: mov al, 0x20  out 0x20, al  pop ax  iret  ; timer ISR  timer: push ax  cmp word[cs:timerflag], 1  jne skipall  inc word[cs:seconds]  push word[cs:seconds]  call printnum ; print tick count  skipall:		je exit	
nextcmp: cmp al, 0xBB jne nomatch mov word[cs:timerflag],0 exit: mov al, 0x20 out 0x20, al pop ax iret  ; timer ISR timer: push ax cmp word[cs:timerflag], 1 jne skipall inc word[cs:seconds] push word[cs:seconds] call printnum ; print tick count  skipall:		mov word[cs:timerflag]	, 1
jne nomatch mov word[cs:timerflag],0  exit: mov al, 0x20 out 0x20, al pop ax iret  ; timer ISR  timer: push ax cmp word[cs:timerflag], 1 jne skipall inc word[cs:seconds] push word[cs:seconds] call printnum; print tick count  skipall:		jmp exit	
mov word[cs:timerflag],0  exit:  mov al, 0x20  out 0x20, al  pop ax  iret  ; timer ISR  timer:  push ax  cmp word[cs:timerflag], 1  jne skipall  inc word[cs:seconds]  push word[cs:seconds]  call printnum; print tick count  skipall:	nextcmp:	cmp al, 0xBB	
exit:  mov al, 0x20 out 0x20, al pop ax iret  ; timer ISR timer:  push ax cmp word[cs:timerflag], 1 jne skipall inc word[cs:seconds] push word[cs:seconds] call printnum ; print tick count  skipall:		jne nomatch	
out 0x20, al pop ax iret  ; timer ISR  timer: push ax cmp word[cs:timerflag], 1 jne skipall inc word[cs:seconds] push word[cs:seconds] call printnum ; print tick count  skipall:		mov word[cs:timerflag]	,0
pop ax iret  ; timer ISR  timer: push ax cmp word[cs:timerflag], 1 jne skipall inc word[cs:seconds] push word[cs:seconds] call printnum ; print tick count  skipall:	exit:	mov al, 0x20	
iret ; timer ISR timer:		out 0x20, al	
; timer ISR timer:		pop ax	
timer:  push ax  cmp word[cs:timerflag], 1  jne skipall  inc word[cs:seconds]  push word[cs:seconds]  call printnum; print tick count  skipall:		iret	
cmp word[cs:timerflag], 1 jne skipall inc word[cs:seconds] push word[cs:seconds] call printnum; print tick count skipall:	; timer ISR		
jne skipall inc word[cs:seconds] push word[cs:seconds] call printnum; print tick count skipall:	timer:	push ax	
inc word[cs:seconds] push word[cs:seconds] call printnum; print tick count skipall:		•	, 1
push word[cs:seconds] call printnum ; print tick count skipall:		•	
call printnum ; print tick count skipall:		= = = = = = = = = = = = = = = = = = = =	
skipall:		-	
		call printnum	; print tick count
	skipall:		
		pop ax	
iret		iret	

**Question3.** Write an isr for software interrupt 0x17, which calculates the run time of any subroutine that the isr invokes/executes in behalf of the user. The label of the subroutine is passed in bx register to the isr. Also ntoe that the time resolution for calculating run time is 1 ms (i.e. the run time will be reported in multiples of 1 ms, which means 1 ms, 2 ms, 3 ms and so on.) You are also required to provide the main /start subroutine. **[25 Marks]** 

Question4.	

i. Consider the elaborate multitasking example 10.2. In this example, each new task created takes one parameter on its stack. Suppose we want to change the intipcb such that, it generalizes the creation of mytask. So if mytask takes one parameter, the stack created for it has one parameter, if it takes zero parameter the

all changes that you will make to initipcb code (line 88	I to 117) and to main (line 204 to 210). [8 Marks]

stack has zero parameter, if it takes two parameters, the stack created has two parameters and so on. Suggest

	shl bx, cl	shl bx, cl	shl bx, cl
	sub bx, 2	sub bx, 4	add bx, 2
iii.			each pcb keeps a track of the number of times it goes int ke in the code to keep a track of this? [9 Marks]

Which of the following is correct implementation if pcb size is increased by two bytes? [2 Marks]

**c.** mov cl, 6

**b.** mov cl, 6

ii.

**a.** mov cl, 6

**d.** none of these

## Question 5. [3+2 Marks]

i.	How many times	int 0x01 will come	in the following code?
----	----------------	--------------------	------------------------

pushf ; setting TF=1
pop ax
or ax, 0x100
push ax
popf

mov cx, 5
rep stosb
mov ax, 0x4c00
int 21h

Solution:		

- ii. Int 0x03 is responsible for:
  - (a) Inserting break point
  - (b) Removing breakpoint
  - (c) Removing opcode
  - (d) Restoring opcode

Best of luck ☺
